

June 29, 2026 – Project Update

Today, I completed the first successful full test run of the RC crawler. The vehicle is currently operating in 2WD and is being driven in reverse because the motor had to be mounted in a different orientation to accommodate the steep front driveshaft angles. This test confirmed that the drivetrain, steering, and suspension are functional while also identifying areas for future improvements, including optimizing the drivetrain layout to enable normal forward operation and eventual 4WD functionality.
